Processing

Data  
Processing

Exercises

- Dynamic string:

```
char *s = (char *) malloc(sizeof(char) * 100);
```

- Creates a character array of size 100
- May only hold a string that can hold *up to 99* characters
- Room is needed for the null terminating character
- *Contents are undefined*; may or may not contain the null terminating character

# Dynamic Strings

Introduction

Declaration

Manipulating  
Characters

String  
Manipulation

String  
Processing

Data  
Processing

Exercises

- Dynamic string:

```
char *s = (char *) malloc(sizeof(char) * 100);
```

- Creates a character array of size 100
- May only hold a string that can hold *up to 99* characters
- Room is needed for the null terminating character
- *Contents are undefined*; may or may not contain the null terminating character
- Allocated on the heap

# Dynamic Strings

- Dynamic string:

```
char *s = (char *) malloc(sizeof(char) * 100);
```

- Creates a character array of size 100
- May only hold a string that can hold *up to 99* characters
- Room is needed for the null terminating character
- *Contents are undefined*; may or may not contain the null terminating character
- Allocated on the heap
- Most of your strings will be of this type

Introduction

Declaration

Manipulating

Characters

String  
Manipulation

String  
Processing

Data  
Processing

Exercises

- Constant string declaration:

```
char *s = "Hello";
```

- Dynamic, allocated on the heap, but
- Creates a *read-only, immutable* string

# Constant Strings

Introduction

Declaration

Manipulating  
Characters

String  
Manipulation

String  
Processing

Data  
Processing

Exercises

- Constant string declaration:

```
char *s = "Hello";
```

- Dynamic, allocated on the heap, but
- Creates a *read-only, immutable* string

- Actually uses `const char *s = "Hello";`

- Constant string declaration:

```
char *s = "Hello";
```

- Dynamic, allocated on the heap, but
- Creates a *read-only, immutable* string
- Actually uses 

```
const char *s = "Hello";
```
- But the compiler generally doesn't catch it!

- Constant string declaration:

```
char *s = "Hello";
```

- Dynamic, allocated on the heap, but
- Creates a *read-only, immutable* string
- Actually uses `const char *s = "Hello";`
- But the compiler generally doesn't catch it!
- Avoid unless you *really want* a dynamically allocated, immutable string for some reason

Exercises

# Part V: Exercises

- Write a string function to change a string's characters to uppercase letters
- Write a string function that returns a new copy of a string with all characters converted to uppercase
- Write a string function to “double space” a paragraph
- Write a “split”-style function: it takes a string and a delimiter and returns an array of strings of the tokens. Ensure no memory leaks!
