Command
Line InputToolkit:
Linters

- A *computer program* is a collection of instructions that performs a specific task when executed by a computer
- A *programming language* is a formal language that specifies a set of instructions that can be used in a program
- We write programs in a code (text) editor or Integrated Development Environment (IDE)
- Source code is *compiled* and run on a particular *operating system*

Introduction

Variables &
Operators

Basic I/O

Exercises

Command
Line Input

Toolkit:
Linters

- *Source code* – plain text files containing computer code.

- *Source code* – plain text files containing computer code.
- *Assembly* – a low-level programming language closer to a processor's actual "language"

- *Source code* – plain text files containing computer code.
- *Assembly* – a low-level programming language closer to a processor's actual "language"
- *Machine Code* – set of instructions executed directly by a computer's central processing unit (CPU)

- *Source code* – plain text files containing computer code.
- *Assembly* – a low-level programming language closer to a processor's actual "language"
- *Machine Code* – set of instructions executed directly by a computer's central processing unit (CPU)
- *Binary* – a sequence of 0s and 1s

- *Source code* – plain text files containing computer code.
- *Assembly* – a low-level programming language closer to a processor's actual "language"
- *Machine Code* – set of instructions executed directly by a computer's central processing unit (CPU)
- *Binary* – a sequence of 0s and 1s

source → assembly → machine

Introduction

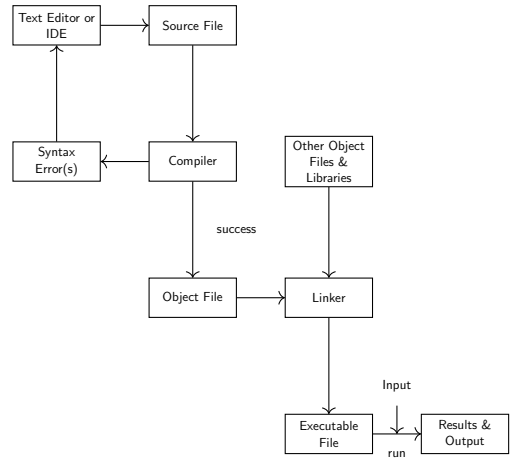

Variables &
Operators

Basic I/O

Exercises

Command
Line Input

Toolkit:
Linters

- Edit a source file, `hello.c`
- Assemble:
`gcc -S hello.c`
- Compile:
`gcc -c hello.c`
- View binary/hex:
`hexdump -C hello.o`
- All in one: `gcc hello.c`
- Run: `./a.out`

Example

Introduction

Variables &
Operators

Basic I/O

Exercises

Command
Line Input

Toolkit:
Linters

```

1  /**
2   * Author: Chris Bourke
3   * Date: November 2, 2016
4   *
5   * This program converts miles to kilometers
6   */
7  #include <stdlib.h>
8  #include <stdio.h>
9
10 #define KMS_PER_MILE 1.60934
11
12 int main(int argc, char **argv) {
13
14     double miles, kms;
15
16     printf("Please enter miles: ");
17
18     scanf("%lf", &miles);
19
20     kms = KMS_PER_MILE * miles;
21
22     printf("%f miles is equal to %f kilometers\n", miles, kms);
23
24     return 0;
25 }
```

Introduction

Variables &
Operators

Basic I/O

Exercises

Command
Line Input

Toolkit:
Linters

- Comments are human-readable messages embedded in code

Comments & Documentation

Introduction

Variables & Operators

Basic I/O

Exercises

Command Line Input

Toolkit: Linters

- Comments are human-readable messages embedded in code
- Single line comments: `// this is a comment`

Comments & Documentation

Introduction

Variables & Operators

Basic I/O

Exercises

Command Line Input

Toolkit: Linters

- Comments are human-readable messages embedded in code
- Single line comments: `// this is a comment`
- Multiple line comments:

```
1  /* This is a multiline
2     comment. */
```

- “Doc-style” comments:

```

1  /**
2   * This is a doc-style comment. It is
3   * a multiline comment commonly used for
4   * large blocks of documentation comments
5   */

```

- “Doc-style” comments:

```

1  /**
2   * This is a doc-style comment. It is
3   * a multiline comment commonly used for
4   * large blocks of documentation comments
5   */

```

- Comments should tell you the *what* and the *why*

Comments & Documentation

Introduction

Variables & Operators

Basic I/O

Exercises

Command Line Input

Toolkit: Linters

- “Doc-style” comments:

```

1  /**
2   * This is a doc-style comment. It is
3   * a multiline comment commonly used for
4   * large blocks of documentation comments
5   */

```

- Comments should tell you the *what* and the *why*
- Code should be self-documenting, code itself should tell the *how*

Preprocessor Directives

- Preprocessor directives tell the compiler to do certain things to the source code before compiling

Introduction

Variables &
Operators

Basic I/O

Exercises

Command

Toolkit:
Linters

- Preprocessor directives tell the compiler to do certain things to the source code before compiling
- Begin with a hash `#`
- Macros: `#define a b`

Preprocessor Directives

Introduction

Variables & Operators

Basic I/O

Exercises

Command Line Input

Toolkit: Linters

- Preprocessor directives tell the compiler to do certain things to the source code before compiling
- Begin with a hash `#`
- Macros: `#define a b`
- Macro usage: defining constants; avoiding “magic” numbers

Preprocessor Directives

Introduction

Variables & Operators

Basic I/O

Exercises

Command Line Input

Toolkit: Linters

- Preprocessor directives tell the compiler to do certain things to the source code before compiling
- Begin with a hash `#`
- Macros: `#define a b`
- Macro usage: defining constants; avoiding “magic” numbers
- Including libraries:

```
1  #include <stdlib.h>
2  #include <stdio.h>
3  #include <math.h>
```

Main Function

Introduction

Variables & Operators

Basic I/O

Exercises

Command Line Input

Toolkit: Linters

- The `main` function is the main entry point of a program

Main Function

Introduction

Variables & Operators

Basic I/O

Exercises

Command Line Input

Toolkit: Linters

- The `main` function is the main entry point of a program
- Without a `main` a program is not *executable*

Main Function

Introduction

Variables & Operators

Basic I/O

Exercises

Command Line Input

Toolkit: Linters

- The `main` function is the main entry point of a program
- Without a `main` a program is not *executable*
- Input/output functions: `scanf`, `printf`

Main Function

Introduction

Variables & Operators

Basic I/O

Exercises

Command Line Input

Toolkit: Linters

- The `main` function is the main entry point of a program
- Without a `main` a program is not *executable*
- Input/output functions: `scanf`, `printf`
- Math functions: `sqrt`, `sin`, `pow`

Introduction

Variables &
Operators

Basic I/O

Exercises

Command
Line Input

Toolkit:
Linters

- In general, executable lines ends with a semicolon ;
- *Blocks* of code are delimited by opening and closing curly brackets { ... }

Introduction

Variables &
Operators

Basic I/O

Exercises

Command
Line Input

Toolkit:
Linters

- In general, executable lines ends with a semicolon `;`
- *Blocks* of code are delimited by opening and closing curly brackets `{ ... }`
- Commas `,` are used to delimit arguments, variables, etc.

Syntax & Punctuation

Introduction

Variables & Operators

Basic I/O

Exercises

Command Line Input

Toolkit: Linters

- In general, executable lines ends with a semicolon `;`
- *Blocks* of code are delimited by opening and closing curly brackets `{ ... }`
- Commas `,` are used to delimit arguments, variables, etc.
- In general, whitespace does not affect a program

Introduction

Variables & Operators

Basic I/O

Exercises

Command Line Input

Toolkit: Linters

- In general, executable lines ends with a semicolon `;`
- *Blocks* of code are delimited by opening and closing curly brackets `{ ... }`
- Commas `,` are used to delimit arguments, variables, etc.
- In general, whitespace does not affect a program
- Keywords: `int`, `double`, `return`

Part II: Variables & Operators

- Variables are program elements that hold *values* that can be *assigned* and *reassigned*

- Variables are program elements that hold *values* that can be *assigned* and *reassigned*
- C is a *statically typed* language

- Variables are program elements that hold *values* that can be *assigned* and *reassigned*
- C is a *statically typed* language
- All variables have a name (*identifier*) and a fixed *type*

- Variables are program elements that hold *values* that can be *assigned* and *reassigned*
- C is a *statically typed* language
- All variables have a name (*identifier*) and a fixed *type*
- Types: integers, floating-point (decimal) numbers, characters, etc.

- Variables are program elements that hold *values* that can be *assigned* and *reassigned*
- C is a *statically typed* language
- All variables have a name (*identifier*) and a fixed *type*
- Types: integers, floating-point (decimal) numbers, characters, etc.
- Variables must be *declared* before they can be used

- Variables are program elements that hold *values* that can be *assigned* and *reassigned*
- C is a *statically typed* language
- All variables have a name (*identifier*) and a fixed *type*
- Types: integers, floating-point (decimal) numbers, characters, etc.
- Variables must be *declared* before they can be used
- The *scope* of a variable is the section(s) of code in which it exists

Basic Types

Integers

- An integer variable: `int`

Introduction

Variables &
Operators

Basic I/O

Exercises

Command
Line Input

Toolkit:
Linters

Basic Types

Integers

- An integer variable: `int`
- A 32-bit signed two's complement integer variable

Introduction

Variables &
Operators

Basic I/O

Exercises

Command
Line Input

Toolkit:
Linters

Basic Types

Integers

- An integer variable: `int`
- A 32-bit signed two's complement integer variable
- Can represent values:

$$-2^{31} = -2,147,483,648 \leq x \leq 2,147,483,647 = 2^{31} - 1$$

Truncation

- Arithmetic with integers results in integers
- Arithmetic with `double` values results in floating-point numbers
- Not the same type of variables; sometimes they are *incompatible*

Introduction

Variables &
Operators

Basic I/O

Exercises

Command
Line Input

Toolkit:
Linters

- Arithmetic with integers results in integers
- Arithmetic with `double` values results in floating-point numbers
- Not the same type of variables; sometimes they are *incompatible*
- Example:

```
1 //okay:
2 int a = 10;
3 double x = 10;
4
5 //in C, this results in truncation
6 int b = 3.14; //b has the value 3
```

- *Truncation* is when the fractional part is “chopped off”

Truncation

Introduction

Variables &
Operators

Basic I/O

Exercises

Command
Line Input

Toolkit:
Linters

- *Truncation* is when the fractional part is “chopped off”
- Especially important with respect to division:

```

1  int a = 10;
2  int b = 20;
3
4  double c = a / b;  //results in 0.0
5
6  //explicit type cast:
7  double d = a / (double) b; //results in 0.5

```
